Operating from UK based Headquarters and an International Sales office in Egypt, Xrio has expanded distribution to overseas markets including Europe, America, Australia, Middle East and Asia. Our products are channelled through a wide spread of IT distributors, and are available from IT resellers, system integrators, online IT retailers and ISPs locally and internationally.

In order to deal with the diverse Internet connectivity challenges faced by organisations today, Xrio has further developed their technology to create a more advanced and unique solution known as UBM - Unified Bandwidth Management. Unified Bandwidth Management incorporates core functionalities such as Internet Link Load Balancing, ISP Bonding, and Bandwidth Management into a single versatile appliance that allows organisations to maximise the use of their Internet connectivity. The Xrio UBM provides link aggregation, resilience and QoS solutions to optimise WAN and VPN connections, enhance web application performance, ensure business continuity, offer scalability, and provide intelligent ISP link and bandwidth management. These benefits can be introduced to a multitude of scenarios and deploy transparently into any network infrastructure without the need for additional network modifications. The UBM appliance range is uniquely positioned to suit budget and requirements of SME's to Large Enterprises.
